                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific the surface protein-1 (MSP-1) and gamete specific (EBA-175), rhoptry associated protein-1 (MSP-1) and gamete specific (EBA-175).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is the antigenic epitope P593, derived from circumsporozoite protein (CSP) of the sporozoite stage of Plasmo, falciparum. It is used in the construction of recombinant protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.

                                                                                                                                                                                                                                                                                                EP398540-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural protein 1 (NS1), [Baez et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NS1 (NS1_81) is linked via a synthetic sequence to DNA encoding Region I contg. flanking regionless the 18 AA signal region, which in turn is fused to DNA encoding Region II-contg. flanking region less the first nine N-terminal AS. This CS fusion is designated RIEdelta9. The Pro residue separating the Asp (at the C-terminal Site. The peptide can be used in a vaccine for protection against malaria

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δĀ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural protein 1 (NS1), [Baez et al., Nucleic Acids Research, 8: 5845; (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NS1; (NS1_81) is linked via a synthetic sequence to DNA encoding Region CI contg. flanking regionless the 18 AA signal region, which in the function of the N-terminal of NS1; (NS1_81) is linked via a synthetic sequence to DNA encoding Region CI contg. flanking region is turn is fused to DNA encoding Region II-contg. flanking region. This CS fusion is designated RLfAuth. The Pro residue separating the Asp (at the C-terminal of the linker) from RLfAuth is an artification of a filled in BamHI site; the Gly separating Region I and Region II-contg. CS flanking regions is an artifact of a synthetic protection against malaria.

The complete nucleotide and AA sequences are given in EP-304720, See also AAR12306-R12311 and AAR13175-R13179.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8X I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural C protein 1 (NSI), [Baez et al., Nucleic Acids Research, 8: 5845] (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NSI C (NSI_81) is linked via a synthetic sequence to DNA encoding Region I contg. flanking region less the 18 AA signal region. This is 11 inked to a synthetic sequence encoding two repeat units from the C linked to a synthetic sequence encoding two repeat units from the Region II-contg. CS asp (at the C-terminal of the linker) from the Region II-contg. CS flanking region is an artifact of a filled-in BamHI site; the Gly region is an artifact of a synthetic FoklyTthIII I linker. The peptide can be used in a vaccine for protection against malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                     US-09-328-352-7241
Sequence 7241, Application US/09328352
GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTE
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CURRENT APPLICATION NUMBER: US/09/328,352

Sequence 65145, Application US/09708427

GENERAL INFORMATION:
APPLICANT: N. ALEXANDROV et al.
TITLE OF INVENTION: SEQUENCE-DETERMINED DNA FRAGMENTS AND CORRESPONDING POLYPEPTIDES

FILE REFERENCE: 2750-1243P

CURRENT APPLICATION NUMBER: US/09/708,427

CURRENT APPLICATION NUMBER: US/09/708,427

CURRENT APPLICATION SEGUENCE: 2000-11-09

NUMBER OF SEQ ID NOS: 85364

SEQ ID NO 65145

LENGTH: 395

TYPE: PATE

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: N. ALEXANDROV et al.
TITLE OF INVENTION: SEQUENCE-DETERMINED DNA FRAGMENTS AND CORRESPONDING POLYPEPTIDES
TITLE OF INVENTION: THERBBY
FILE REFERENCE: 2750-1243P
CURRENT FILING DATE: 2000-11-09
NUMBER OF SEQ ID NOS: 85364
SOFTWARE: Patentin version 3.1
SEQ ID NO 68198
LENGTH: 212
TYPE: PRT
ORGANISM: Zea mays subsp. mays
FEATURE:
NAME/KEY: misc_feature
LCCATION: 1. 212
OTHER INFORMATION: Xaa is any amino acid
NAME/KEY: misc_feature
LCCATION: 1. 212
OTHER INFORMATION: Ceres Seq. ID 1934091

The DNA encoding the 1st 81 AAs of the N-terminal of NS1 (NS1,81) is linked to a synthetic sequence encoding four repeat units from the immunodominant region, which in turn is linked via a synthetic sequence to DNA encoding Region I conty. Flanking a synthetic sequence to DNA encoding Region I conty. Flanking region less the 18 AA signal region. This is linked to DNA encoding Region II-conty. Flanking region. The pro-residue separating the Asp (at the C-terminal of the linker) from the Region I-conty. CS flanking region is an arrifact of a filled-in Bamili site; the GJy separating the Region I and II-conty. CS flanking regions is an arrifact of a synthetic FOKI/ThIII I linker. The peptide can be used in a vaccine for protection against malaria.

                                                                                                                                                                                                                                                                                                Length 335;
                                                                                                                                                                                                                                                               0;
                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                  0;
                                                    The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural protein 1 (NSI), [Baez et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 Aas of the N-terminal of NSI (NSI.81) is linked to a synthetic sequence encoding four repeat units (the variant form) from the immunodominant region, which in turn is linked via a synthetic sequence to DNA encoding Region I contg. flanking region less the 18 AA signal region. This is contg. flanking region less the 18 AA signal region. This is residue separating the Asp (at the C-terminal of the linker) from the Region I-contg. CS flanking region is an aftifact of a filleding half site; the Gly separating the Region Taking regions is an artifact of a synthetic Foki/TthIII linker. The peptide can be used in a vaccine for protection against malaria.

The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), liver stage antigen-17 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of plasmodium falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         T-cell epitope; tetanus toxoid; antigenic epitope; treatment; circumsporozoite protein; CSP; sporozoite surface protein-1; SSP-2; liver stage antigen-1; LSA-1; merozoite surface protein-1; MSP-1; MSP-1 apical membrane antigen-1; AMA-1; erythrocyte binding antigen-175; EBA-175; rhoptry associated protein-1; RAP-1; gamete specific antigen; Pfg27; antiparasitic; prevention; anti-CDC/NIIMALVAC-1 antibody; begans

                                               sequence of the CS gene (AAN81108) is from lambda-mpf1. A recombinant DNA molecule is claimed, comprising functional DNA coding sequence fused, in phase, to a portion of the Pre-S2 region of a hepatitis B virus (HBV) pre-S2-S protein coding sequence. The functional DNA coding sequence comprises the Pre-S2 coding sequence, Pre-S1 coding sequence of Pre-S1-pre-S2 coding sequence, the CS protein coding sequence of Plasmodium, or a HIV coding sequence such as an HIV envelope gene sequence, e.g. HIV C7 protein coding region, HIV peptide 121 coding region, or HIV Dreesman peptide coding region.

                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is the antigenic epitope P593, derived from circumsporozotic protein (CSP) of the sporozotic stage of plasmodium circumsporozotic protein. To the open protein (CSP) of the sporozotic stage of plasmodium confunction. It is used in the construction of recombinant protein.

The recombinant protein comprises, melittin signal peptide, (His)6 tag, crell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozotic protein (CSP), sporozotic surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozotic surface protein-1 (MSP-1), merozotic surface protein-1 (MSP-1), merozotic surface protein-1 (MSP-1), crell applied antigen-175 (RSB-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. Falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     T cell helper site; cytotoxic T cell response; neutralising antibody; P.falciparum CS antigen; circumsporozoite; malaria; vaccine.
         Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle \,

Gaps
                                        The peptide AAR66442 was synthesised to make a peptide vaccine which is recognised by a broad range of MHC types that will elicit a T helper cell response, a CTL response and a high titre neutralising antibody response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polypeptide comprising immunogenic determinants from P falciparum for vaccine against malaria infection in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /label- AAs 297-412 of CS protein

RESULT

(first entry) 06-JUN-2000

Plasmodium falciparum CSP antigenic epitope, P593.

Recombinant protein; CDC/NIIMALVAC-1; multivalent; malaria; vaccine;

T-cell epitope, tetanus toxoid, antigenic epitope, treatment; circumsporozoite protein. CSP: sporozoite surface protein-1: SSP-2: liver stage antigen-1; LSA-1; merozoite surface protein-1; MSP-1; MSP-2; apical membrane antigen-1; AMA-1: erythrocyte binding antigen-175; EBA-175; rhoptry associated protein-1; RAP-1; gamete specific antigen; Pfg27; antiparasitic; prevention; anti-CDC/NIIMALVAC-1 antibody.

                                                                                                                                                                                                                                                             ö
                 The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., CScience 225: 593 (1984)], and the influenza virus non-structural protein [NSI], [Baez et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAS of the N-terminal of NSI (NSI 81) is linked via a synthetic sequence to DNA encoding Region I contg. flanking regionless the 18 AA signal region, which in turn 1s fused to DNA encoding Region II-contg. flanking regions st has 1st and the C. This CS fusion is designated RLfAuth. The Pro residue separating the ASP (at the C-terminal of the linker) from RLfAuth is an artifact of a filled in BamHI site; the GJY separating Region II-contg. CS flanking regions is an artifact of a synthetic RottyTriIII I linker. The peptide can be used in a vaccine for protection against malaria.
                                                                                                                                                                                                                                                              Gaps

The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., the P. falciparum circumsporozoite (CS) protein [Dame et al., coince 225 : 593 (1984)], and the influenza virus non-structural protein 1 (NSI), [Baez et al., Nucleic Acids Research, 8 : 5845 (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NSI (NSI_81) is linked via a synthetic sequence to DNA encoding Region I contg. flanking region less the 18 AA signal region. This is linked to a synthetic sequence encoding two repeat units from the immunodominant region, which in turn is fused to DNA encoding the segion II-contg. flanking region. The Pro residue separating the Region II-contg. CS flanking region is an artifact of a filled-in BamHI site; the Gly separating the repeat units and the Region II-contg. CS flanking region is an artifact of a synthetic Fokl/TthIII I linker. The region is an artifact of a synthetic Fokl/TthIII I linker. The peptide can be used in a vaccine for protection against malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                      Polypeptide comprising immunogenic determinants from P falciparum - for vaccine against malaria infection in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note= "Influenza virus nonstructural protein 1"

The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural protein 1 (NSI). [Baez et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NSI (NSI_81) is linked via a synthetic sequence to DNA encoding Region I contg. flanking regionless the 18 AA signal region, which in turn is fused to DNA encoding Region II-contg. flanking regionless the first nine N-terminal AAs: This CS fusion is designated RLfdeltay. The Pro residue separating the Asp (at the C-terminal site. The peptide can be used in a vaccine for protection against

Gaps
         The product is useful in preparation of vaccines for treatment and prophylaxis of plasmodium sporozite infection. It may be easily produced in large pure quantities from a transformed E.coli
                                                                                                                                                                                                                                                                                                                                                                                                         /note= "Influenza virus nonstructural protein 1" 32..87

                                                                                                                                                                                                                                                                                                                                                                                                 The Plasmodium CS gene was used to isolate peptides capable of inducing an immune response to the parasite. Peptide antigens be synthesised in pure form and used to generate an immune response in vaccination against malaria. The featured repeat units are claimed and must be present in copies of 2-1000.

                                      circumsporozolte protten (CSP) of Plasmodium falciparum strain 7G8, an amino acid Arg created by the cloning procedure, four amino acids, Pro-Val-Thr-Asn, representing the four carboxy terminal residues of hepatitis B virus (HBV), adw serotype, pre52 protein, and a stretch of 226 amino acids specifying the S protein of HBV, adw serotype. This protein, and RTS* (see also AAR37797), may be combined with an adjuvant and used in a vaccine for preventing plasmodium infections. The vaccines produce a humoral response and also a cellular immune
                                                                                                                                                                                            acids, Met-Ala-Pro, derived from a nucleotide sequence created by the cloning procedure used to construct the hybrid gene, a stretch of 189 amino acids representing amino acids 210 to 398 of the
                                                                                                                                                                                                                                                  This sequence represents the RTS hybrid protein which is encoded by the RTS expression cassette. This hybrid consisits of a methionine residue derived from S. cerevisiae TDH3 gene sequence, three amino

                                                                                  transformed host cell, a method of culturing the cell to produce CS, to protein, and a vaccine. The vector comprises a 192 bp Sau3A fragment derived from Sau3A digestion of a 1215 bp StuT-RsaI fragment of containing the P. falciparum CS protein derived from Sau3A digestion of a 1215 bp StuT-RsaI fragment of WR201 approx. Its first 50 bp, or two, three, form
                                                                                                                                                                                                                  Plasmid WR201 was obtained from the Walter Reed Army Institute of Research, and results from insertion of a 2.3 kb EcoRI fragment from lambda mpfl encoding the complete CS protein gene P. falciparum into vector pUC8. A recombinant DNA vector is claimed, which comprises a DNA sequence contg. the coding sequence of the CS P. falciparum operatively linked to an expression control sequence. Prefd. expression control sequences include the yeast glyceraldehyde-3p-dehydrogenase gene (TDH3) promoter and the yeast ornithine carbamoyl transferase gene (ARG3)
                                                                               containing the P. approx. its first such 192 bp Sau3A
                                                                                                                                                                            transcription termination region. A suitable coding sequence comprises the 1215bp StuI-RsaI fragment of WR201 contg. the P. falciparum CS protein coding sequence, minus its first 50bp. Also claimed is a

This sequence represents the RTS* hybrid protein which is encoded by the RTS* expression cassette. This hybrid consisits of a methionine residue derived from S. cerevisiae TDH3 gene sequence, three amino acids, Met-Ala-Pro, derived from a nucleotide sequence created by the cloning procedure used to construct the hybrid gene, a stretch of 189 amino acids representing amino acids 210 to 398 of the circumsporozoite protien (CSP) of Plasmodium falciparum strain NF54, an amino acid Arg created by the cloning procedure, four amino acids, pro-Val-Thr-Asn, representing the four carboxy terminal residues of hepatitis B virus (HBV), adw serotype, pre52 protein, and a stretch of 256 amino acids specifying the S protein of HBV, adw serotype This protein, and RTS (see also AAR37796), may be combined with an adjuvant and used in a vaccine for preventing, plasmodium infections.
